BUSINESS INSIGHTS REPORT | MARKETING CAMPAIGN EDA

A concise review of campaign efficiency, funnel performance and budget decisions

$1.82M	$59.43M	32.66×	386,182	$4.71
Media spend	Attributed revenue	Blended ROAS	Conversions	Blended CPA

EXECUTIVE TAKEAWAY

The sample reports $1.82M in media spend against $59.43M in attributed revenue, or 32.66× blended ROAS. The summary identifies Email as the strongest modeled channel (3,062.12× ROAS) and Display as the weakest (0.63×). This unusually wide gap warrants a measurement and cost audit before any budget shift.

FUNNEL PERFORMANCE

CTR: 3.15% **Click-to-conversion:** 5.41% **Cost / conversion:** $4.71

The funnel metrics provide two diagnostic questions: are campaigns earning relevant clicks, and are landing pages converting that interest? Improve the weakest transition rather than optimizing clicks or attributed revenue in isolation.

CHANNEL SIGNAL

Email: validate list acquisition, platform, creative and staff costs; check whether conversions would have happened without the email. **Display:** review placements, audience fit, frequency, creative and landing-page relevance.

RECOMMENDED BUSINESS ACTIONS

1. Validate the data. Reconcile spend, revenue, campaign IDs, conversion events, currencies and attribution windows.

2. Compare full economics. Add gross margin, refunds, fulfilment, platform and operating costs; report contribution margin and fully loaded CPA.

3. Test incrementality. Use a randomized holdout or geo-based test to estimate conversions caused by advertising, not merely attributed to it.

4. Reallocate carefully. Test marginal budget changes and scale only when incremental contribution remains attractive.

DECISION

Do not move budget solely on historical ROAS. Treat the reported 60% performance-led / 40% experimentation split from the earlier project as an illustrative test framework—not a live spending recommendation.

DATA NOTE & LIMITATIONS

This report uses figures from the existing project summary for 1,000 generated campaign records across six channels (Jan 2025–Dec 2026). The row-level CSV was not available for independent re-analysis. Gross margin, refunds, LTV, audience overlap, attribution windows and complete channel costs are missing. Results are synthetic, not actual company performance.

Method: ROAS = attributed revenue ÷ media spend; CPA = media spend ÷ conversions. Aggregate rates should be calculated from summed counts, not a simple average of campaign percentages. Research basis: Google Ads Conversion Lift guidance and Google Meridian GeoX experiment design documentation. Currency assumption: USD.
